Description

The ebay Organizer is a convenient way for the user to organize his/her sales activity on ebay.

The user can enter item listings, important information files, and search ebay for similar item listings.

Features

- Add and update item listings with a number of details.
- Add important files such as invoices and shipping documents.
- Search eBay for similar items to determine the price of an item.

Planning - User Stories

My user stories included creating the landing page and the each of the three pages that are available on the landing page. I also had several pages for each of the feature pages.

Planning - Database

I have two main tables. I have one for the item listings and one for the important information that is added to the application.

Technology Stack

- Java
- Spring
- Thymeleaf
- MySql
- IntelliJ

Demo

What I Learned

- Spring Security
- Learning api calls
- MVC
- To commit often

What's Next

- Add more sites, such as etsy.
- Include CSS to make it look better.
- Eclipse IDE
